IDEAL CUSTOMER PROFILE

Who Buys the Print

The institutions that need private open/close price formation for tokenised assets — who they are, what they pay for, and why they are already on Canton.

CrossDesk's customers are not a bet on a future market. The buyers of a private, verifiable open/close price — tokenised-fund issuers, institutional desks, and market operators — are already issuing, trading, and settling real assets on the exact network CrossDesk is built on. The demand exists; the primitive does not.

~$30B
tokenised RWA on-chain today — ~2× since Jan 2025

~400
institutions building on the Canton Network ecosystem

~$30B
public tokenised-RWA AUM (~$15B tokenised US Treasuries)

$2.5B
BlackRock BUIDL — the anchor tokenised money-market fund

$16T
projected tokenised-RWA market by 2030 (BCG)

CrossDesk — the fund-issuance / primary-market layer for tokenised assets on Canton: atomic in-kind create & redeem plus a K-of-N committee-struck official NAV, produced by a sealed uniform-price call auction.

Prepared July 2026 · Sebastian Borjas · github.com/superbigroach/canton-dvp-settlement-desk

Named institutions illustrate segment fit from public sources; they are not customers, users, or endorsers. See Sources.

Executive summary

CrossDesk is the fund-issuance / primary-market layer for tokenised assets: atomic in-kind create & redeem (deliver the underlyings ↔ mint/burn shares) plus a K-of-N committee-struck official NAV — a credibly-neutral price no single admin sets — produced by a sealed uniform-price call auction and settled cross-asset with atomic DvP (no principal risk). It sells to three institutional segments that share one need: a fair, private, verifiable price at the open and close for tokenised assets. All three are already building on Canton, where DTCC, Euroclear, Goldman Sachs, JPMorgan, BNY Mellon and ~400 institutions are standing up tokenised-asset infrastructure. DTCC — which custodies roughly **$114T** of securities — has now **begun** tokenising real securities on Canton (its first production pilot, July 2026); the live tokenised-RWA market is **~$30B** today across all chains and growing fast. Every one of those assets will need an official price / NAV.

> ### Primary ICP → tokenised-fund & RWA operators that need in-kind primary issuance *and* a private daily NAV.
> The beachhead is the Canton-native asset issuers who are live now and have the most acute, unmet need for on-chain create/redeem and a trustworthy on-chain price. **Already built:** CrossDesk is a full stack — Daml contracts (18/18 tests green), a Spring Boot backend over the Ledger API, and a React desk — deployed and connected on the shared HackCanton Canton 3.x devnet node (backend connects over TLS + JWT; reads work end-to-end, with writes pending a node-operator actAs grant).

Segment	Core need	What they pay for
1 · Tokenised-fund / RWA operators (primary)	Atomic in-kind create & redeem *and* a private, auditable daily NAV / official close their shares mark to	Issuance + NAV-as-a-service (per-auction / subscription)
2 · Institutional desks & large holders	Execute block size without leakage or MEV	Per-auction execution fee (bps on notional)
3 · Venues, custodians & operators	A compliant open/close cross to offer members	Platform / SaaS licence

The market is already here — on Canton

Tokenisation stopped being a pilot. Public tokenised-RWA AUM sits at roughly **~$30B on-chain today across all chains** — about **2× since January 2025** — including **~$15B of tokenised US Treasuries** (76 products) and live funds from BlackRock (**BUIDL ~$2.5B**), Franklin Templeton (**BENJI ~$828M** across 8 chains), Ondo/Securitize, Apollo, Hamilton Lane and WisdomTree. BCG projects **$16T by 2030**.

And the institutional weight is being **built on Canton**: roughly **~400 ecosystem participants**, a Foundation co-chaired by **DTCC and Euroclear**, and participants including **Goldman Sachs, JPMorgan, BNY Mellon, BNP Paribas, HSBC, Citadel Securities, Deutsche Börse and Visa**. **DTCC — which**

custodies roughly $114T of securities — has **begun** tokenising real securities on Canton, with its first live production trades in **July 2026** (a pilot across 50+ firms, including BlackRock and JPMorgan). That $114T is the custody *ceiling* DTCC has only started to tokenise — not an amount already live. Goldman's GS DAP runs live DvP and JPMorgan's Kinexys is rolling out. Every one of these assets will need an official price / NAV.

PRIMARY ICP · SEGMENT 1

Tokenised-fund & RWA issuers / operators

Who: firms issuing tokenised funds, MMFs, Treasuries and credit — BlackRock (BUIDL, ~$2.5B), Franklin Templeton (BENJI, ~$828M across 8 chains), Ondo / Securitize, Hashnote (USYC), Apollo, Hamilton Lane, WisdomTree; on Canton specifically **DTCC** (tokenising US securities) and **JPMorgan Kinexys** (tokenised MMFs).

Pain: they need **two** things and have neither on-chain — (1) an **in-kind create / redeem** primitive to bring baskets in and mint shares (and burn shares to hand underlyings back) atomically, and (2) a **daily official NAV / close** for redemptions, collateral marks and reporting. Today that price is struck off-chain or by a single oracle; there is no private, verifiable mechanism that *produces* the mark from real supply and demand.

Trigger: launching or scaling a tokenised fund on Canton and needing on-chain primary issuance plus a benchmark counterparties will trust.

Decision-makers: Head of Digital Assets / Tokenisation (champion) · Fund Operations / NAV (user) · Product · Compliance (must sign the audit posture).

Why CrossDesk: atomic in-kind create & redeem for primary issuance, plus a K-of-N committee-struck clearing price that *is* the official close — deterministic, on-ledger, un-gameable, private, with a need-to-know audit receipt. Issuance + NAV-as-a-service, not "another exchange."

SEGMENT 2

Institutional trading desks & large holders

Who: asset managers, proprietary and market-making desks (e.g. Citadel Securities on Canton), crypto-native OTC / prime brokers, and treasuries holding tokenised assets — anyone moving size in cETH (onRails), CBTC (BitSafe), USDC (Circle), or tokenised Treasuries.

Pain: executing **block size** without leakage. On continuous venues a large order is front-run; on transparent chains it is fully exposed in the mempool (MEV). There is no private venue to clear size at one fair price.

Trigger: needing to move a large position in a tokenised asset without moving the market or revealing intent.

Decision-makers: Head of Trading / Execution (economic buyer) · Portfolio Manager (user) · Risk.

Why CrossDesk: sealed orders, one uniform clearing price, pro-rata rationing, atomic settlement — impact-free, MEV-proof block execution.

SEGMENT 3

Venues, custodians & market operators

Who: settlement & market infrastructure (DTCC, Euroclear, Deutsche Börse — Canton Foundation members), Canton asset venues and wallets (Temple, Bron, C8, Console), custodians (e.g. Copper), and native asset issuers (onRails / cETH, BitSafe / CBTC).

Pain: they hold assets, members, and flow — but have **no native auction / benchmark primitive** to run a compliant open/close cross or publish an official price for their market.

Trigger: launching or operating a market for a tokenised asset and needing price formation + a benchmark.

Decision-makers: Head of Product / Market Operations (economic buyer) · Compliance.

Why CrossDesk: a white-label, compliant closing/opening cross with observers wired in — the missing market-structure layer.

The beachhead — where to land first

Do not open by selling to DTCC. Land with the **Canton-native asset issuers who are live now and feel the pain today** — and expand toward the DTCC / Goldman / JPMorgan tier as tokenised Treasuries and funds scale on the network.

Beachhead target	Why them first
onRails (cETH) & **BitSafe (CBTC)**	Live assets, small app layer, actively courting builders (hackathon bounties). Acute need for venues + price; directly reachable now.
Emerging tokenised-fund operators on Canton	Launching funds that need an on-chain NAV; no incumbent solution; a private auction is a clean wedge.
Canton venues / wallets (Temple, Bron, C8, Console)	Already carry the assets; want differentiated market structure to offer members.

> **Land-and-expand:** prove the auction on cETH/CBTC and one tokenised fund → become the reference price-formation layer → follow the assets up to institutional Treasuries and MMFs as DTCC/Kinexys scale.

Buyer map & how to validate

Who's in the room

- **Champion:** Head of Digital Assets / Tokenisation
- **User:** Fund Ops / NAV team, or the trading desk
- **Economic buyer:** COO / Head of Markets / Product
- **Blocker:** Compliance / Risk — neutralised by the permissioned identities + immutable, need-to-know audit trail

Validation plan

- Interview the **cETH / CBTC teams** (onRails, BitSafe) on venue + price gaps
- Ask 3–5 **tokenised-fund / ops** contacts: how do you strike NAV on-chain today, and what would you pay for a private auction that produces it?
- Reachable via the **Canton ecosystem** (Foundation, HackCanton, venue teams) — a warm, dense network
- Success signal: a named operator agrees the on-chain NAV / block-leakage pain is real and unaddressed
